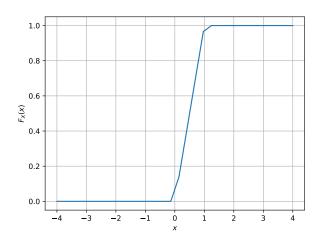

Fig. 1.2. The CDF of U

CONTENTS

1 Uniform Random Numbers

1 Uniform Random Numbers

Let U be a uniform random variable between 0 and 1.

1.1 Generate 10^6 samples of U using a C program and save into a file called uni.dat .

Solution: Download the following files and execute the C program.

Assignment 1/codes/exrand.c Assignment 1/codes/coeffs.h

1.2 Load the uni.dat file into python and plot the empirical CDF of *U* using the samples in uni.dat. The CDF is defined as

$$F_U(x) = \Pr\left(U \le x\right) \tag{1.2.1}$$

Solution: The following code plots Fig. 1.2

Assignment 1/codes/cdf_plot.py

1.3 Find a theoretical expression for $F_U(x)$. **Solution:** The Probaility Density Function for Uniform Distribution is given by:

$$f(x) = \begin{cases} 1 & x \in [0, 1] \\ 0 & \text{Otherwise} \end{cases}$$
 (1.3.1)

The Cumulative Distribution Function is defined by

$$F_U(x) = \int_{-\infty}^x f(x) dx$$

So, we can split in for three intervals, as

$$F_U(x) = \int_{-\infty}^0 f(x)dx + \int_0^1 f(x)dx + \int_1^\infty f(x)dx$$

Accordingly, we have three cases as follows: Case 1:

$$\int_{-\infty}^{0} f(x) dx$$

if x < 0 then, f(x) = 0 and but $\lim_{x \to \infty} F(x) = 0$ Case 2:

$$\int_0^1 f(x)dx$$

if $0 \le x \le 1$ then,

$$\int_0^1 f(x)dx = \frac{1}{1-0} \int_0^1 dx = \left[\frac{x}{1-0} \right]_0^1 = 1$$

Case 3:

$$\int_{1}^{\infty} f(x)dx$$

if x > b then, f(x) = 0 but $\lim_{x \to \infty} F(x) = 1$ Thus, The Cumulative Distribution for uniform random variable is given as follows:

$$F_U(x) = \Pr(U \le x) = \begin{cases} 0 & \text{for } x < 0 \\ \frac{x - 0}{1 - 0} & x \in [0, 1] \\ 1 & \text{for } x > 1 \end{cases}$$
(1.3.2)

1.4 The mean of U is defined as

$$E[U] = \frac{1}{N} \sum_{i=1}^{N} U_i$$
 (1.4.1)

and its variance as

$$var[U] = E[U - E[U]]^2$$
 (1.4.2)

Write a C program to find the mean and variance of U.

Solution: The C Program is executed in the following

Assignment 1/codes/exrand.c Assignment 1/codes/coeffs.h

The mean value is 0.50 and variance value is 0.083

1.5 Verify your result theoretically given that

$$E\left[U^{k}\right] = \int_{-\infty}^{\infty} x^{k} dF_{U}(x) \tag{1.5.1}$$

Solution: Mean is given by $E[U] = \int_0^1 x dF_U(x)$ Accordingly,

$$E[U] = \int_0^1 x dF_U(x)$$
$$= \int_0^1 x dx$$
$$= \left[\frac{x^2}{2}\right]_0^1$$
$$= \frac{1}{2} = 0.50$$

Now, for $E[U^2]$, we have,

$$E[U^{2}] = \int_{0}^{1} x^{2} dF_{U}(x)$$
$$= \int_{0}^{1} x^{2} dx$$
$$= \left[\frac{x^{3}}{3}\right]_{0}^{1}$$
$$= \frac{1}{3}$$

Now, we know from 1.4 that,

$$var[U] = E[U - E[U]]^{2}$$

$$= E[U^{2} - 2UE[U] + (E[U])^{2}]$$

$$= E[U^{2}] - 2E[U]E[U] + E[E[U]^{2}]$$

$$= E[U^{2}] - 2E[U]^{2} + E[U]^{2}$$

$$= E[U^{2}] - E[U]^{2}$$

Substituting the Values for E[U] and $E[U^2]$ in the above equation, we get,

$$var[U] = \frac{1}{3} - \left(\frac{1}{2}\right)^2$$
$$\frac{1}{3} - \frac{1}{4} = \frac{1}{12} = 0.083$$

Hence Proved.
